Inspired by the previous damage criteria ( Hu et al., 2010b ), the following exponential function is proposed: (4.24)  $d_m = d_{mc} ( 1 - \exp ( - b d - p ) )$  where  $d_{mc}$  is the critical value of mechanical damage,  $b$  is a model parameter which controls the evolution rate of mechanical damage.

Ultimate tensile strength, often shortened to tensile strength, ultimate strength, or  $F_{tu}$  within equations, is the maximum stress that a material can withstand while being stretched or pulled before breaking. In brittle materials the ultimate tensile strength is close to the yield point, whereas in ductile materials the ultimate tensile strength can be higher. The ultimate tensile strength is usually found by performing a tensile test and recording the engineering
