Foodborne trematodiasis result in severe liver and lung disease. Safe and efficacious medicines are available to prevent and treat foodborne trematodiasis. Prevention and management of food-borne trematodes requires cross-sectoral collaboration on the human-animal and ecosystems interface.

### Foodborne trematode infections

Infection with *Metagonimus yokogawai*, a related trematode, has been reported after eating raw or undercooked freshwater or brackish fish in the Far East, Siberia, Manchuria, the Balkan states, Israel, and Spain. Intestinal infection with *Nanophyetus salmincola* has been reported after ingestion of raw or undercooked salmon.

### Heterophyiasis and Related Trematode Infections ...

A significant number of trematode infections are transmitted by consuming contaminated food. Although most of these infections are only mildly pathogenic, severe pathology in humans is caused by four main genera: *Clonorchis* spp. (that cause clonorchiasis); *Opisthorchis* spp. (that cause opisthorchiasis); *Fasciola* spp. (that cause fascioliasis); and *Paragonimus* spp. (that cause paragonimiasis).

### WHO | Foodborne trematode infections

Research of Trematode Infections has been linked to Infective Disorder, Intestinal Schistosomiasis, Fish Diseases, Schistosomiasis, Nematode Infections. The study of Trematode Infections has been mentioned in research publications which can be found using our bioinformatics tool below. Researched pathways related to Trematode Infections include Immune Response, Localization, Aging, Pathogenesis, Parasitism.

### Trematode Infections and Diseases of Man and Animals - V ...

Digenetic trematodes form a major group of human parasites, affecting a large number of humans, especially in endemic foci. Over 100 species have been reported infecting humans, including blood, lung, liver, and intestinal parasites. Traditionally, trematode infections have been diagnosed by parasitological methods based on the detection and the identification of eggs in different clinical samples.
